

Patient survey report 2012

Survey of people who use community mental health services 2012

Cornwall Partnership NHS Foundation Trust

The survey of people who use community mental health services 2012 was designed, developed and co-ordinated by the Co-ordination Centre for the NHS Patient Survey Programme at Picker Institute Europe.

Making patients' views count

National NHS patient survey programme

Survey of people who use community mental health services 2012

Re-design of the benchmark reports

This is a new style of benchmark report, replacing the previous reports produced for the national surveys which contained scores out of 100. We have designed this report using feedback from people who use the data. The data contained here uses the same scoring system as before but presents the data as a score out of 10, and displays trusts' performance in a different way to the previous reports, using a more robust statistical technique. The scores and groupings now match those presented under the organisation search tool available on the CQC website:

<http://www.cqc.org.uk/surveys/mentalhealth>

The Care Quality Commission

The Care Quality Commission is the independent regulator of health care and adult social care services in England. We also protect the interests of people whose rights are restricted under the Mental Health Act. Whether services are provided by the NHS, local authorities or by private or voluntary organisations, we focus on:

- **Identifying risks** to the quality and safety of people's care
- **Acting swiftly** to help eliminate poor-quality care.
- Making sure **care is centered on people's needs** and protects their rights.

Survey of people who use community mental health services 2012

To improve the quality of services that the NHS delivers, it is important to understand what service users think about their care and treatment. One way of doing this is by asking people who have recently used their local health services to tell us about their experiences.

The survey results are primarily intended to be used by NHS trusts to help them improve their performance. We have included data from the survey in the Quality and Risk Profiles for providers, which contributes to our assessment of compliance with the essential standards of quality and safety set by the government. The Department of Health will also use the results for performance assessment, improvement and regulatory purposes.

The 2012 survey of people who use community mental health services involved 61 NHS trusts in England (including combined mental health and social care trusts, Foundation Trusts and primary care trusts that provide mental health services). We received responses from more than 15,000 service users, a response rate of 32%. Service users aged 18¹ and over were eligible for the survey if they were receiving specialist care or treatment for a mental health condition and had been seen by the trust between 1 July 2011 and 30 September 2011. The survey included service users in contact with local NHS mental health services, including those who receive care under the Care Programme Approach (CPA). Fieldwork took place between February and June 2012.

Similar surveys of community mental health services were carried out in 2010 and 2011. They are part of a wider programme of NHS patient surveys, which covers a range of topics including acute inpatient services, and A&E (Emergency Department) services. To find out more about our programme and for the results from previous surveys, please see the links contained in the further information section.

The data in this report

This report shows how a trust scored for each question in the survey, compared against the range of results from all other trusts that took part in the survey. It is designed to help in understanding the performance of individual trusts, and to identify areas for improvement.

¹Previous surveys have included service users aged 16 and over. However, the 2012 survey was granted section 251 approval from the National Information Governance Board (NIGB) under section 251 of the NHS Act 2006 on the basis that 16 and 17 year olds were excluded.

PLEASE NOTE: As the reports have been re-designed, these groupings are different from those used in the previous style of benchmark report, which showed the top 20% and bottom 20% of scores. The groupings here are instead based on a statistical analysis involving the use of adjusted Z scores and winsorisation. More detail can be found in the Methodology section, and in the technical report (see link in the 'further information' section).

Results displayed in this report are a graphical representation of the results displayed for the public under the organisation search tool on the CQC website. The same data is shown on the website in a more simplified way, identifying whether a trust performed 'better' or 'worse' or 'about the same' as the majority of other trusts for each question.

You can also find on the CQC website the national overall results (as percentages of respondents) for the 2012 survey compared to those from 2011, alongside a national summary highlighting the key issues.

Interpreting the report

This report provides a score for each question, and a score for each section². The scores for each question are grouped according to the sections of the questionnaire as completed by respondents. For example, the survey includes sections on 'health and social care workers' and 'medications' amongst others.

For each question in the survey, the individual responses were converted into scores on a scale of 0 to 10. A score of 10 represents the best possible response. Therefore, the higher the score for each question, the better the trust is performing.³

It is not appropriate to score all questions within the questionnaire - not all of the questions assess the trusts in any way, or they may be 'filter questions' designed to filter out respondents to whom following questions do not apply. An example of a filter question would be Q9 "In the last 12 months, have you taken any prescribed medication for your mental health condition?"

The graphs in this report display the scores for this trust, compared with the full range of results from all other trusts that took part in the survey. Each bar represents the range of results for each question across all trusts. In the graphs, the bar is divided into three sections:

- If your trust score lies in the orange section of the graph, your trust result is 'about the same' as most other trusts in the survey
- If your trust score lies in the red section of the graph, your trust result is 'worse' compared with most other trusts in the survey
- If your trust score lies in the green section of the graph, your trust result is 'better' compared with most other trusts in the survey.

Text to the right of the graph clearly states whether the score for your trust is 'about the same', 'better' or 'worse' compared with most other trusts in the survey.

A black diamond represents the score for this trust. The black diamond (score) is not shown for questions answered by fewer than 30 people because the uncertainty around the result would be

²Labelled S1-S9 in the 'section scores' table

³Trusts have differing profiles of service users. For example, one trust may have more male service users than another. This can potentially affect the results because people tend to answer questions in different ways, depending on certain characteristics. For example, older respondents tend to report more positive experiences than younger respondents, and women tend to report less positive experiences than men. This could potentially lead to a trust's results appearing better or worse than if they had a slightly different profile of service users. To account for this, we 'standardise' the data. Results have been standardised by the age and sex of respondents to ensure that no trust will appear better or worse than another because of its respondent profile. This helps to ensure that each trust's age-sex profile reflects the national age-sex distribution (based on all of the respondents to the survey). It therefore enables a more accurate comparison of results from trusts with different profiles of service users.

too great. The trust will also not have a section score for the corresponding section, this is because the section data is not comparable with other trusts, as it is made up of fewer questions.

You may find that there is no red area, and/or no green area in the charts shown for some questions. This can occur in the analysis of the data and is an acceptable consequence of the statistical technique that is used. The size of the orange area is constructed by considering how different all trust scores are across the range, as well as the confidence we can have in that particular trust's score (by looking at the number of respondents to that question). In some cases, this will lead to such a wide margin of error that the 'expected range' (the orange section) will be very wide, and hence will also cover the highest or lowest scoring trusts for that question.

At the end of the report you will find tables containing the data used for the graphs and background information about the service users that responded. In the table containing the data you will also find the results for your trust from the 2011 survey and a column called 'change from 2011' which uses arrows to indicate whether the score for this years shows a statistically significant increase (up arrow), a statistically significant decrease (down arrow) or has shown no statistically significant change (no arrow) compared with 2011⁴. A statistically significant difference means that the change in the results is very unlikely to have occurred by chance. Where a result for 2011 is not shown, this is because the question was either new this year, or has had the question wording and / or the response categories changed, meaning that it is not possible to compare the results as we do not know if any change is caused by alterations in the survey instrument, or variation in service performance⁵. As the 2012 survey was granted section 251 approval from the National Information Governance Board (NIGB) on the basis that 16 and 17 year olds were excluded, the 2011 data has been recalculated to exclude 16-17 year olds to enable fairer comparison of the results. Due to this there may a small difference in the scores for your trust as published here from those published in 2011.

Methodology

The categories described above are based on a statistic called the 'expected range' which is uniquely calculated for each trust for each question. This is the range within which we would expect a particular trust to score if it performed 'about the same' as most other trusts in the survey. The range takes into account the number of respondents from each trust as well as the scores for all other trusts. This means that where a trust is performing 'better' or 'worse' than the majority of other trusts, this is likely to be a true reflection of all service users that have visited the trust, rather than being unique to those who responded to the survey.

A technical document providing more detail about the methodology and the scoring applied to each question is available on our website (see further information section).

Notes on specific questions

Seven of the questions in the questionnaire have different scoring for respondents who receive their care under the Care Programme Approach and other respondents who do not. These questions are: Q19, Q26, Q27, Q28, Q42, Q43, and Q44. This is to reflect the differences in national policy in relation to those under the Care Programme Approach (CPA) and other service users in contact with secondary mental health services which could result in differences in the service that people receive.

Q28: (In the last 12 months have you had a care review meeting to discuss your care plan?). Respondents who stated at Q2 that they have been in touch with mental health services for less than a year have been removed from the base for this question.

⁴Results were tested for significance using two-sample t-tests

⁵Please note that comparative data is only shown for question data, and not for the section data.

Further information

The full national results for the 2012 survey are on the CQC website, together with an A to Z list to view the results for each trust (alongside the technical document outlining the methodology and the scoring applied to each question):

www.cqc.org.uk/PatientSurveyMentalHealth2012

The results for the 2010 and the 2011 community mental health survey can be found on the NHS surveys website at:
